

READ DATA

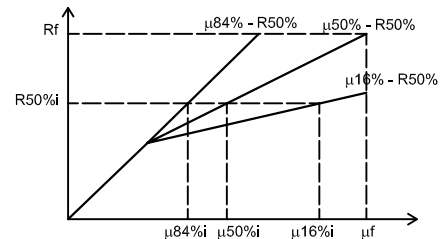

- a. Limits (droof and drift)
- b. Idealised pushover
- c. Building parameters (T and Γ)
- d. Correspondance droof-drift (from pushover or linear)

METHODOLOGY

from Limits to μ_{ds}

build R50%- $\mu_{50\%}$
R50%- $\mu_{16\%}$
R50%- $\mu_{84\%}$ curves

- a. discretize R in R_i
- b. get $Cr_{50\%,i}$ and $\beta_{Cr,i}$
- c. get $\mu_{50\%,i}$, $\mu_{84\%,i}$ and $\mu_{16\%,i}$ from $\beta_{Cr,i}$

find R50%,ds
R16%,ds
R84%,ds interpolating the curves for μ_{ds}

Find Sa50%,ds
from R50%,ds
and βSa_{ds} from R16%,ds and R84%,ds

RESULTS

vuln = 0

$\beta\theta_c = 0$
median Sa,ds = Sa50%,ds
dispersion Sa,ds = βSa_{ds}

$\beta\theta_c > 0$

vuln = 1

$\beta\theta_c = 0$

$\beta\theta_c > 0$

- a. Aplly consequence function to single set of μ_{ds}
- b. Get mean LR for each IML

- a. Sample MC sets of μ_{ds}
- b. From each $\mu_{ds,i}$ get Sa,ds,i and $\beta Sa_{ds,i}$
- c. Apply consequence function to MC sets of Sa,ds and βSa_{ds}
- d. Get MC values of LRs for each IML
median LR = mean(LRs) for each IML
dispersion LR = st.dev(LRs) for each IML

- a. Sample MC values of μ_{ds}
- b. From each $\mu_{ds,i}$ get Sa,ds,i and $\beta Sa_{ds,i}$
- c. From each Sa,ds,i and $\beta Sa_{ds,i}$ sample MC Sa,ds,i,j
- d. Combine together all MC*MC values of Sa,ds,i,j
median Sa,ds = mean(Sa,ds,i,j)
dispersion Sa,ds = st.dev(Sa,ds,i,j)
